SECURITY ALERT: LastPass Breach: Change Master Password Now

LastPass has stated the following:

- The breach has affected limited development source code and internal technical documents
- No user data was impacted
- Due to their zero knowledge architecture there is no way for anyone to gain access to master passwords

Out of an abundance of caution Pillar is recommending everyone change their LastPass Master password immediately (Profile/Account Settings). This master password change will force a re-encryption of all passwords stored under the master.

As a reminder, activate multi-factor authentication on your LastPass account.
